

Safeguarding & enhancing the ecosystem co-benefits of REDD+

Lera Miles, UNEP-WCMC

27 April 2010

UN-REDD workshop: identifying and promoting ecosystem co-benefits from REDD+

Aims

UN-REDD
PROGRAMME

Working Paper:
Safeguarding and
enhancing the
ecosystem co-
benefits of REDD+

UN-REDD PROGRAMME

1st DRAFT, 21 April 2010

UN-REDD Ecosystem Co-benefits Series

2

Issues paper -

Explore impacts of REDD+ decisions on
ecosystem co-benefits

Measures and tools to safeguard
and enhance ecosystem co-benefits

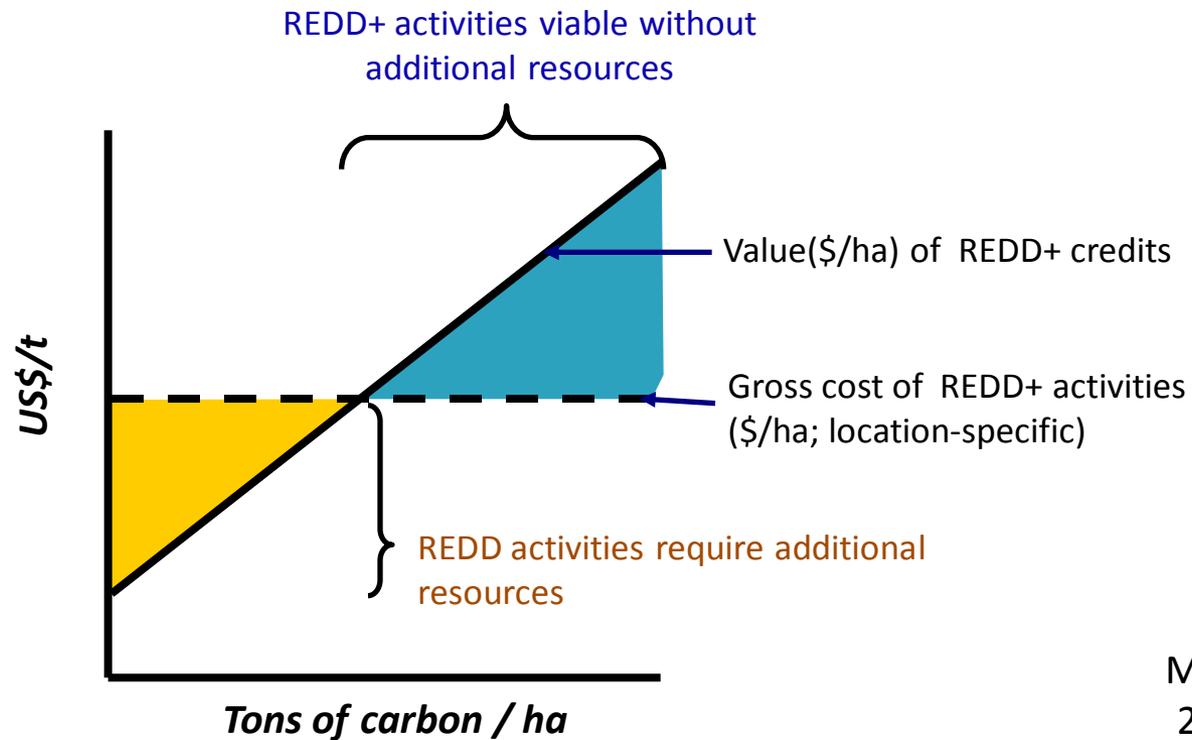

Where, what and how?

Influences on ecosystem co-benefits

- **Where** are REDD+ efforts concentrated?
 - Biodiversity and ecosystem services vary with location
- **What** activities ? (AWG-LCA list)
 - *Reducing emissions from deforestation;*
 - *Reducing emissions from forest degradation;*
 - *Conservation of forest carbon stocks;*
 - *Sustainable management of forest;*
 - *Enhancement of forest carbon stocks.*PLUS preparation & cross-cutting activities
- **How** are activities implemented?
 - Approach will affect ecosystem co-benefits
 - Tools / measures to safeguard & enhance
 - (& monitoring & adaptive management)

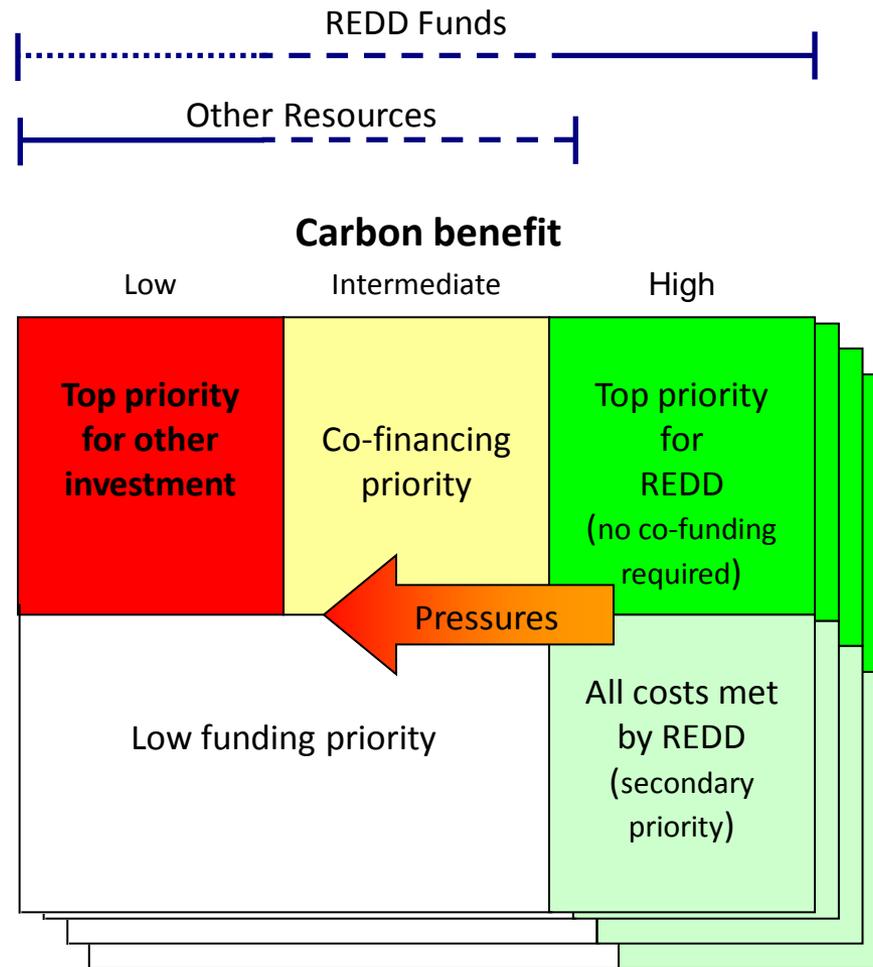

Where: not all forests are equally likely candidates for REDD+ implementation

Miles & Kapos
2008, *Science*

Where: Investment decisions will influence ecosystem co-benefits

Ecosystem co-benefits for:

- Biodiversity
- Water
- Soils
- NTFPs
- ...

Miles & Kapos
2008, *Science*

Preparation stage

Which ecosystem co-benefits are valued?

- Institutional arrangements
- Range of stakeholders involved

What knowledge on impacts?

- Capacity building plans
- Scope of policy analysis

Are ecosystem co-benefits planned for?

- Forest definitions
- Goals of demonstration activities
- Goals of priority-setting analysis

Options to support ecosystem co-benefit delivery

... in preparation stage:

- acquiring and sharing **data** on biodiversity and ecosystem services
- taking the likely impacts on biodiversity and ecosystem services into account when **selecting REDD+ approaches**
- defining **goals** for ecosystem co-benefits delivery
- identifying **institutional responsibilities** for these goals
- designing cost-effective **monitoring systems** to allow assessment of the goals
- **planning for adaptive management**

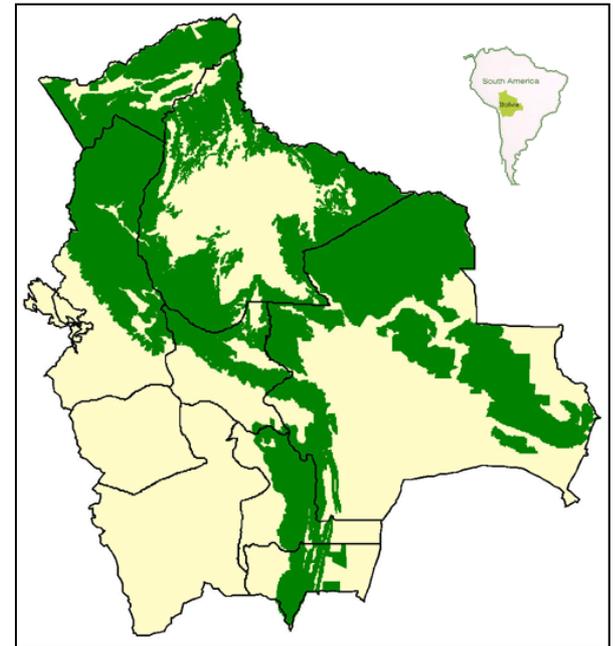

Tools: metadatabase of spatial data

Example: Bolivia

Many good map datasets exist
Diverse stakeholders responsible

Neutral facilitator to create metadatabase
and share with all:

- Content
- Format
- Methods
- Custodian
- Potential use in REDD+ decision-making
to safeguard & enhance co-benefits

Source: CADEFOR, Bolivia.

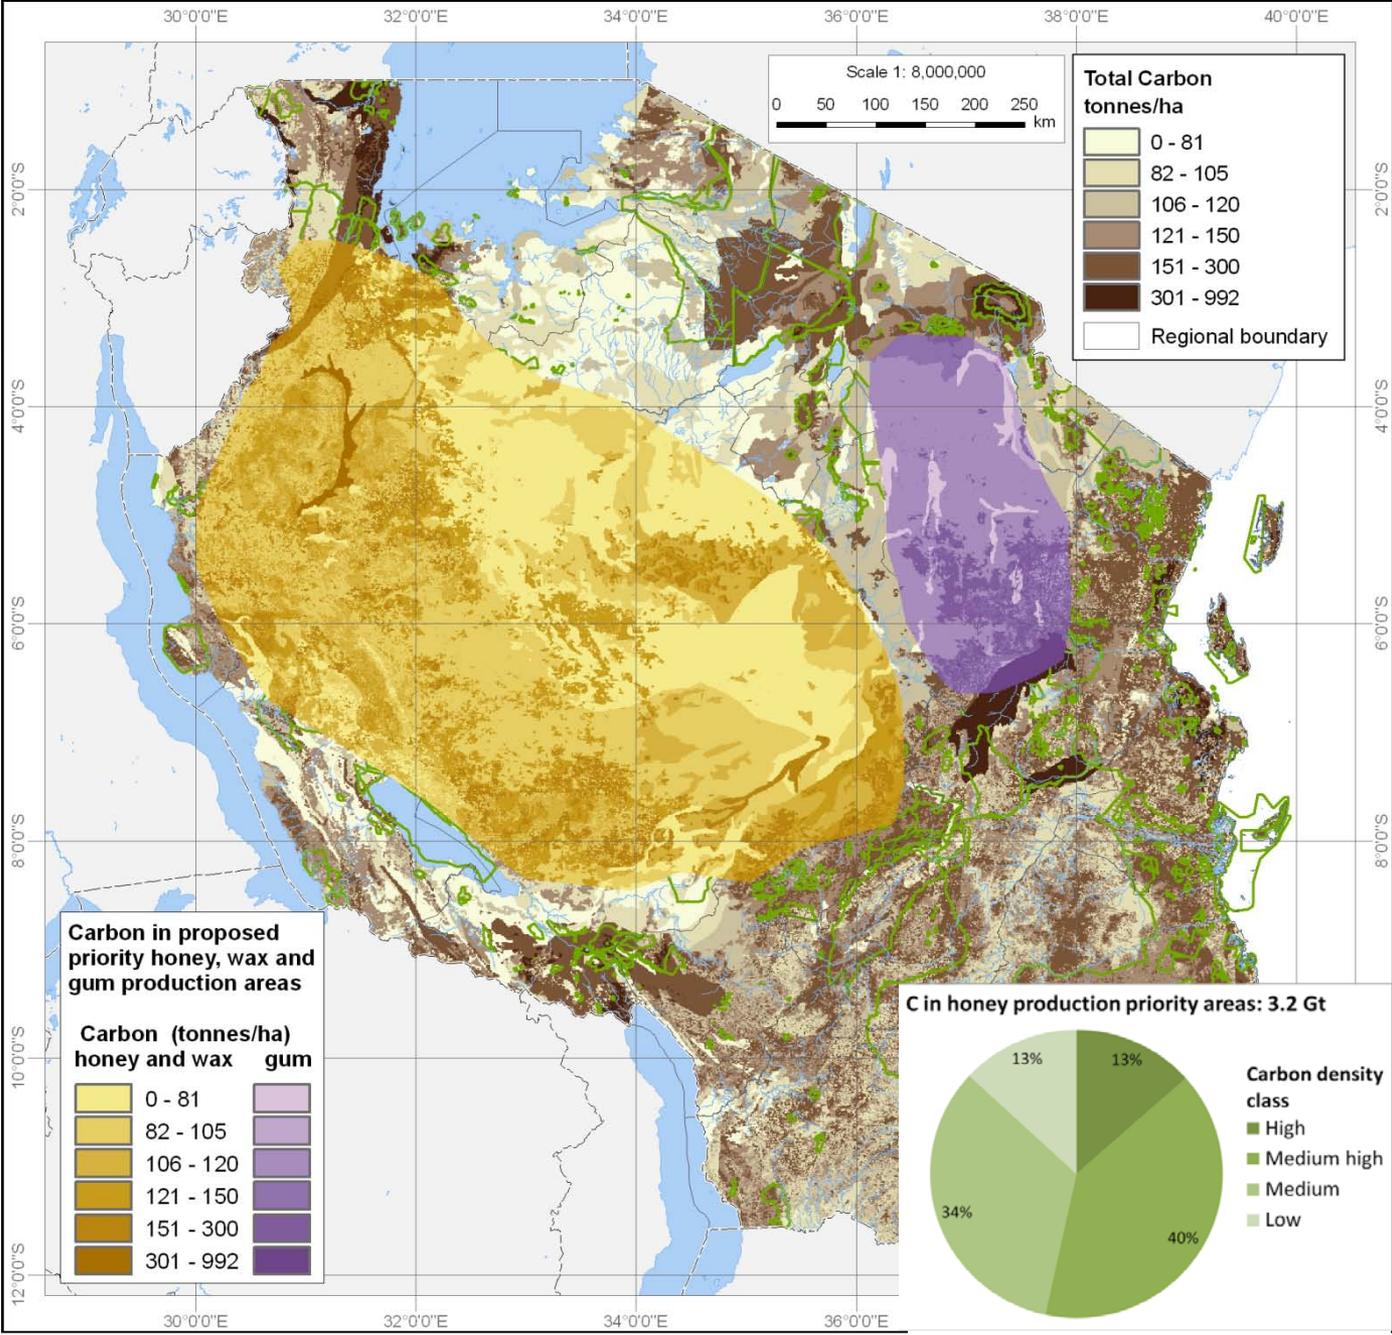

<http://www.cadefor.org/en/certfor/mapaforbol.php>

Tools: ecosystem service mapping.

Carbon overlaid

Use Planning
Commission
2006)

Options to support ecosystem co-benefit delivery

... when making decisions on REDD+ implementation:

- **attention to ecosystem service issues** when deciding how to implement the REDD+ strategy
- **participatory planning** with local stakeholders to ensure that local ecosystem co-benefit values are understood and taken into account
- **communication** to all stakeholders of potential impacts and trade-offs
- **policies, tools and measures** to safeguard and enhance the delivery of ecosystem co-benefits
- absorb **lessons from the demonstration phase** and ensure **adaptive management** for ecosystem co-benefits

Reducing deforestation

Tool	Ecosystem co-benefits	Costs and trade-offs
Spatial priority-setting	Any selected co-benefits	Trade-offs, but explicit. Analysis may slow decisions.
Encourage agroforestry near natural forest	Biodiversity	Restricts choice; also risks to forest
Promote conservation agriculture	Soil formation, nutrient cycling, freshwater	Revision of agricultural extension
Adopt agricultural certification standards	Biodiversity, soil formation, freshwater	Costs v premium for certified goods

Table 7: Ecosystem co-benefits tools and measures – reducing deforestation

Forest carbon stock enhancement

Tool	Ecosystem co-benefits	Costs and trade-offs
No clearing of native vegetation	All co-benefits	Minimal
Spatial priority setting for FLR & guidance	Any selected co-benefits	Analysis may slow decisions
Restoration of degraded forest	Possible: food, wood/fibre, fuel, biodiversity, freshwater	Minimal cost, but fairly slow
Favourable management within plantations	Structure is more natural (e.g. mixed age and mixed species stands, understory exists). All co-benefits	Slower carbon storage, but more resilient in longer-term
Restoration instead of planting		

**Table 11:
Ecosystem co-benefits tools and measures – carbon stock enhancement (A/R)**

Tools: score card for A/R activities

Approach	Ecosystem service – result and speed of delivery							
	Biodiversity		Water regulation & quality		Soil		NTFPs	
Natural regeneration	5	☆	5	☆	5	☆(☆)	4	☆
Assisted natural regeneration	5	☆☆	5	☆☆	5	☆☆(☆)	4	☆☆
Planting native species	4	☆☆ ☆	5	☆☆ ☆	4	☆☆ ☆	5	☆☆ ☆
Planting non-native species	2	☆☆ ☆	5	☆☆ ☆	3	☆☆ ☆	3	☆☆

Key:

Final result of a/r: 1 (low provision of service) to 5 (high provision of service)

Speed of delivery: ☆ (slow) to ☆☆☆ (rapid)

Summary

- Where?, What REDD activity? and How implemented? affect co-benefits
- Design phase, especially on ‘where’ and ‘what’, avoids inadvertent harms
- Wide engagement & buy-in is crucial
- Trade-offs often exchange short-term use of resources for long-term sustainable use
- ...but some opportunities for co-benefits at minimal cost
- Limited knowledge: monitoring of impacts & adaptive management

LETTER

Forests in Flux

Reducing Greenhouse Gas Emissions from Deforestation and Forest Degradation: Global Land-Use Implications

Lera Miles¹ and Valerie Kapos²

Introduction

Concurrent with the rapid increase in land-use change, the world's forests are being lost at an unprecedented rate. This loss is a major contributor to climate change, as forests are a significant carbon sink. The loss of forests also reduces biodiversity and ecosystem services. This letter discusses the implications of forest loss for climate change and biodiversity conservation, and offers recommendations for policy makers.

Carbon, biodiversity & ecosystem services: exploring co-benefits

-benefits

Jiangxi Province, China

Carbon, biodiversity & ecosystem services: exploring co-benefits

-benefits

Tanzania

Introduction

Carbon, biodiversity, and ecosystem services are interconnected. This report explores the co-benefits of REDD+ in Jiangxi Province, China, and Tanzania. It highlights the importance of integrating biodiversity and ecosystem services into REDD+ programs to maximize benefits for local communities and the environment.

PROGRAMME

Thank you for listening!

Reducing forest degradation

Tool	Ecosystem co-benefits	Costs and trade-offs
Spatial priority-setting for action on illegal logging	Any selected co-benefits	Trade-offs, but explicit. Analysis may slow decisions.
Restoring water table in drained peat swamp forests	All ecosystem co-benefits	Major carbon benefits possible for minimal costs

Table 8: Ecosystem co-benefits tools and measures – reducing forest degradation

Sustainable management of forest

Tool	Ecosystem co-benefits	Costs and trade-offs
Capacity building for reduced-impact logging	All –especially soils, freshwater, flood regulation, biodiversity	Wood yields over longer timescale All other services: RIL still affects forest structure
Ecoforestry	As above, less change to forest structure	As above
Certification schemes	Depends on choice of standard	Cost of verification by external certifiers
Adaptive management for climate resilience	More likely long-term provision of all co-benefits. Biodiversity (genetic diversity)	Training of forest managers and workers

**Table 10:
Ecosystem co-benefits tools and measures – sustainable management of forest [for timber]**

Conservation of forest carbon stocks

Tool	Ecosystem co-benefits	Costs and trade-offs
Systematic conservation planning tools	Any selected co-benefits	Trade-offs, but explicit. Analysis may slow decisions.
PA management effectiveness tools	Any selected co-benefits	Management and monitoring for some co-benefits risks harming others
Capacity building on ecosystem co-benefits for protected area staff and stakeholders	Any selected co-benefits	

Table 9: Ecosystem co-benefits tools and measures – conservation of forest carbon stocks

Protected area effectiveness?
